The acetabular labrum is a rim of cartilage surrounding the socket of the hip joint.

Damage to the labrum can result from various causes, including trauma and degeneration.

Labral tears can be painful, but also may be found incidentally on imaging studies.

Femoroacetabular impingement is a clinical syndrome associated with labral tears.

Femoral neck fractures in the elderly are frequent, represent a great health care problem, and have a significant impact on health insurance costs. Reconstruction options using hip arthroplasty include unipolar or bipolar hemiarthroplasty (HA), and total hip arthroplasty (THA). The purpose of this review is to discuss the indications, limitations, and pitfalls of each of these techniques.
