Adjust the levels of clothing, perspiration, and exercise to maintain a stable internal temperature as the external temperature changes. Water and blood sugar levels need to be replenished regularly, and fatigue occurs with heavy exercise. Severe hypothermia, heat stroke, or dehydration can result if internal stability is not maintained.

The reason lab reference ranges vary for thyroid markers is because laboratories determine normal values using the “bell curve” method. When you get a blood test, your results include your value — shown as an absolute number, like 1 milliunit per liter TSH — and a “reference range,” which is the so-called normal value for TSH.

## *Do You Have Thyroid Symptoms with “Normal” Lab Results?*
