second-order method in time. It is implicit in time and can be written as an implicit Runge–Kutta method, and it is numerically stable. The method was developed by John Crank and Phyllis Nicolson in the mid 20th century. For diffusion equations (and many other equations), it can be shown the Crank–Nicolson ...

Crank–Nicolson method - Wikipedia

One of the most popular methods for the numerical integration (cf. Integration, numerical) of diffusion problems, introduced by J. Crank and P. Nicolson in 1947. They considered an implicit finite difference scheme to approximate the solution of a non-linear differential system of the type which arises in problems of heat flow.

Crank-Nicolson method - Encyclopedia of Mathematics
The Crank-Nicolson method is a well-known finite difference method for the numerical integration of the heat equation and closely related partial differential equations. We often resort to a Crank-Nicolson (CN) scheme when we integrate numerically reaction-diffusion systems in one space dimension

the solution to the CN equation $LhU_{n+1} = R hU_n$. Then there exists constants, independent of $h; k; u$ such that $\max_{1 \leq i \leq N} |LhU_{n+1} - R hU_n| \leq C (h^2 + \tau^2) \max_{(x;t) \in Q} |u_{xx} + u_t|$ (5) Proof As before we plug the

Parameters: T_0 : numpy array. In 1D, an N element numpy array containing the initial values of T at the spatial grid points. In 2D, a $N \times M$ array is needed where N is the number of x grid points, M the number of y grid points.

I need to solve a 1D heat equation $u_{xx}=u_t$ by Crank-Nicolson method. The temperature at boundaries is not given as the derivative is involved that is value of $u_x(0,t)=0$, $u_x(1,t)=0$. I solve the equation through the below code, but the result is wrong because it has simple and known boundaries.

$u_{i,n+1}$ gives the explicit solution $u_{i,n+1} = (k h^2 a + k 2h b)u_{i+1,n} + (1 + kc - 2k h^2 a)u_{i,n} + (k h^2 a - k 2h b)u_{i-1,n}$ (14)

One could then proceed to calculate all the $u_{i,n+1}$'s from the $u_{i,n}$'s and recursively obtain u for the entire grid. Since equation (3) applies only to the interior gridpoints, we at each time step would have to make use of some

Crank-Nicolson scheme ¶ The idea in the Crank-Nicolson scheme is to apply centered differences in space and time, combined with an average in time. We demand the PDE to be fulfilled at the spatial mesh points, but in between the points in the time mesh: / [$tu(x_i, t_{n+1/2}) = \frac{1}{2} (x_i^2 u(x_i, t_n) + 1/2).$

Altogether, the general solution of the problem (7.3) can be written as $u(x,t) = \sum_{n=1}^{\infty} A_n \sin \frac{n\pi x}{L} \exp - D \frac{n^2 \pi^2}{L^2} t$, $A_n = \text{const}$. In order to find A_n one can use the initial condition (7.4). Indeed, if we write the function $f(x)$ as a Fourier series, we obtain: $f(x) = \sum_{n=1}^{\infty} F_n \sin \frac{n\pi x}{L} =$

$n=1$ $A_n \sin \frac{n\pi x}{L}$, $A_n = F_n = \frac{2}{L} \int_0^L f(x) \sin \frac{n\pi x}{L} dx$. Hence, the general solution of Eq. (7.3) reads:
