MX341 AUTOMATIC VOLTAGE REGULATOR (AVR) SPECIFICATION, INSTALLATION AND ADJUSTMENTS

General description Technical specification. MX341 is a two phase sensed Automatic Voltage Regulator and forms part of the excitation system for a brush-less generator. Excitation power is derived from a three-phase permanent magnet generator (PMG), to isolate the AVR control circuits from the effects of non- linear loads and to reduce radio frequency interference on the generator terminals.

SX460 AUTOMATIC VOLTAGE REGULATOR (AVR) - Generator Solutions

The AVR (automatic voltage regulator) is suitable for supplying power to the fields of either brushless or commutator type exciters and will maintain the A.C generator voltage within plus and minus 1% of the preset value with paralleling. When the load varies between no load and rated load and with a frequency changes more than plus minus 4%. Upon application or rejection of rated load, the generator voltage recovers to plus and minus 1% within 0.3 second on most AVR exciter in A.C generator ...

The AVR includes a stability or damping circuit to provide good steady state and transient performance of the generator.

The correct setting can be found by running the generator at no load and slowly turning the stability control anti-clockwise until the generator voltage starts to become unstable.

This pushes the AVR to its limits. If the AVR is pushed beyond it's limits the excitation field collapses. The output voltage is reduced to a small amount. If a short circuit occurs in the supply to the AVR, the generator will not have an excitation source. This causes a loss of generator power output.
